

WHY IS WATER TANK CLEANING SO IMPORTANT

Important for health

Clean water prevents disease outbreaks. Some common health problems that arise due to impure water include dysentery, cholera and gastroenteritis.

Reduces maintenance costs

If a tank is maintained regularly, it saves time, effort and money. There are less chances of the tank structure or the associated water systems being damaged.

Essential for tank maintenance

Regular cleaning prevents buildup of sediment and silt and reduces the probability of rusting and corrosion which could deteriorate tank structure.

Prevents plumbing issues

Regular cleaning prevents build up of impurities which could lead to plumbing issues in the valves and pipes that supply the water to a building.

STAGNANT WATER IS A BREEDING GROUND FOR

- **Bacteria** - Legionella, E. Coli, Pseudomonas, Shigella and Salmonella
- **Viruses** - Norovirus, Enterovirus, Rotovirus, Influenza and Hepatitis A virus
- **Parasites** - Giardia lamblia
- **Algae** - Blue-green algae
